The invention relates to human PRP-1-derived oligopeptides (AAB48771-AAB48783) which contain at least two arginine residues and which protect against dental caries. PRPs (proline-rich proteins) are salivary proteins encoded by six clustered genes on chromosome 12p13.2 and are potential determinants of a person's susceptibility to dental caries. PRPs are degraded by Actinomyces and Streptococcus species to small peptide fragments. These are metabolised by oral bacteria for nutritional purposes, with certain bacterial species generating ammonia via the catabolism of arginine. The peptides of the invention, being arginine-tich, can also be converted to ammonia by these bacteria. The ammonia thus formed raises the pH at the dental surface, thereby protecting the derived oligopeptides of the invention
                                                                                                                                                                                                                                                                                                                                                                                 Human, PRP-1; proline-rich protein; saliva; dental caries;
chromosome 12p13.2; arginine catabolism; ammonia production; pH increase;
oral bacterium; caries prevention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New oligopeptides comprising 2 arginine residues from degradation proline-rich proteins, useful for preventing dental caries.
                                                                                                                                                                                                                                                                                                                                                    Human saliva PRP-1 fragment (residues 99-115), SEQ ID NO:13.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                100.0%; Score 62; DB 4; Length 17; 100.0%; Pred. The invention relates to a single exon nucleic acid probe for measuring human gene expression in a sample derived from human foetal liver. The single exon nucleic acid probes may be used for predicting, measuring and displaying gene expression in samples derived from human fetal liver. The present sequence is a peptide encoded by a single exon nucleic acid probe of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Human genome-derived single exon nucleic acid probes useful for analyzing gene expression in human fetal liver.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Peptide #6360 encoded by probe for measuring placental gene expression.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                 Human; foetal liver; gene expression; single exon nucleic acid probe
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               .

The present invention provides a number of single exon nucleic acid probes which are derived from genomic sequences expressed in the human bone marrow. They can be used to measure gene expression in bone marrow samples, which may enable the improved diagnosis and treatment of cancers such as lymphoma, leukaemia and myeloma. The present sequence is a protein encoded by one of the probes of the invention
                                                                                                                      Human genome-derived single exon nucleic acid probes useful for analyzing gene expression in human bone marrow.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human; brain expressed exon; gene expression analysis; probe; microarray; Alzheimer's disease; multiple sclerosis; schizophrenia; epilepsy; cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention provides a number of single exon nucleic acid probes which are derived from genomic sequences expressed in the human brain. They can be used to measure gene expression in brain cell samples,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human brain expressed single exon probe encoded protein SEQ ID NO: 31599.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Single exon nucleic acid probes for analyzing gene expression in human brains.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Example 4; SEQ ID NO 31599; 650pp + Sequence Listing; English.

                                                                                                                                                                                                                                                                                                                                                                                                                  Human genome-derived single exon nucleic acid probes useful for analyzing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention relates to single exon nucleic acid probes (SENP: see AAI31115-AAI57546). The present sequence is a peptide encoded by one such probe in the probes are useful for producing a microarray for predicting, measuring and displaying gene expression in samples derived from human placenta. The probes are useful for antenatal diagnosis of human genetic disorders
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human; bone marrow expressed exon; gene expression analysis; probe; microarray; cancer; leukaemia; lymphoma; myeloma.

The invention relates to a single exon nucleic acid probe (SENP) (I) for measuring human gene expression in a sample derived from human adult liver, comprising one of 13109 defined nucleotide sequences given in the specification (or complements/ fragments). The probe hybridises at high stringency to a nucleic acid molecule expressed in the human adult liver. (I) may be used for predicting, measuring and displaying gene expression in samples derived from human adult liver. The genes identified may be involved in genetic liver diseases such as cirrhosis.

The principle cornary heart disease. ABG47346-ABG5930 represent human sasciated with cornary heart disease. ABG47346-ABG5930 represent human liver single exon encoded peptides of the invention. Note: The sequence information for this patent does not appear in the printed specification but was obtained in electronic format directly from WIPO at the wipo int/pub/published_pot_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  genome-derived single exon nucleic acid probes useful for analyzing
which may enable the diagnosis and improved treatment of nervous system diseases such as Alzhainer's disease, multiple sclerosis, schizophrenia, epilepsy and cancers. The present sequence is a protein encoded by one of the probes of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                Human, liver, cirrhosis, hyperlipoproteinaemia, hyperlipidaemia, hypercholesterolaemia, coronary heart disease.

The invention relates to a spatially-addressable set of single exon nucleic acid probes for measuring gene expression in a sample derived from human lung comprising single exon nucleic acid probes having one of 12614 nucleic acid sequences mentioned in the specification, or their complements or the 12187 open reading frames derived from human lung, omprising den expression in a sample carid expressed in the human lung, measuring gene expression in a sample cellection of detectably labeled nucleic acids derived from human lung man, and (b) measuring the label detectably bound to each probe of the array, identifying exons in a eukaryotic genome, comprising (a) and prithmically predicting at least one exon from genomic sequences of the eukaryote; and (b) detecting specific hybridisation of detectably aloning from the eukaryote; and (b) detecting specific hybridisation of detectably having a fragment identical to the predicted exon, the probe is included in the above mentioned microarray; assigning exons to a single gene,
                                                                                                                                                                                                                                                                                                                                 Human peptide encoded by genome-derived single exon probe SEQ ID 31538.
                                                                                                                                                                                                                                                                                                                                                                                         chronic obstructive pulmonary disease; interstitial lung disease; familial idiopathic pulmonary fibrosis, neurofibromatosis; tuberous sclerosis; Gaucher's disease; Niemann-Pick disease; Hermansky-Pudlak syndrome; sarcoidosis; Niemann-Pick disease; pulmonary histiocytosis; lymphangioleiomyomtosis; Karagener syndrome; pulmonary histocytosis; lymphangioleiomyomtosis; Karagener syndrome; pulmonary alveolar proteinosis; fibrocystic pulmonary dysplasia; hyaline membrane disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     set of single exon nucleic acid probes, used to
                                                                                                                                                                                                                                                                                                                                                                             Human, single exon probe, asthma, lung cancer, COPD, ILD,
chronic obstructive pulmonary disease; interstitial lung disease;

comprising (a) identifying exone from genomic sequence by the method
above and (b) measuring the expression of each of the exons in several
tissues and/tor cell types using hybridisation to a single exon
microarrays having a probe with the exon, where a common pattern of
expression of the exons in the tissues and/or cell types indicates that
the exons should be assigned to a single gene, a peptide comprising one
of 12011 sequences, mentioned in the specification, or encoded by the
probes/open reading frames (ORF). The probes are used for gene expression
analysis, and for identifying exons in a gene, particularly using human
lung derived mRNA and for the study of lung diseases such as asthma, lung
cancer, chronic obstructive pulmonary disease (COPD), interstitial lung
disease (ILD), familial idiopathic pulmonary fibrosis, neurofibromatosis,
tuberous sclerosis, gaucher's disease, Niemann-Pick disease, Hermansky-
Pudlak syndrome, garcoidosis, pulmonary haemosiderosis, pulmonary
histiocytosis, lymphangioleiomyomntosis, primary ciliary
dyskinesis, pulmonary hypertension and hyaline membrane disease. The
present sequence is a peptide/protein encoded by a single exon probe of
the invention. Note: The sequence data for this patent did not form part
of the printed specification, but was obtained in electronic format
directly from WIPO at ftp.wipo.int/pub/published_pot_equences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Sequence 132 AA;

ACFO3547 to ACFO3570 encode the human NOVX proteins (1) given in ABR57412 to ABR57435. (1) have cytostatic, cardiant, antiinflammatory, nootropic, immunosuppressive, antializeric, anticomplex, antializeric, anticomplex, immunosuppressive, antializeric, anticonvolant, hypotensive, antibacterial, relaxant, antiarthritic, hepatotropic, neuroprotective, antibacterial, relaxant, vulnerary, angiogenic antianglogenic activities, and can be used in vulnerary, angiogenic and antianglogenic activities, and can be used in contermine the presence or absence of (1) in a sample. The NOVX polypeptides and their antibodies can be used to determine the presence or absence of (1) in a sample. The NOVX polypeptides, polymucleotides encoding them, and antibodies against them, are useful in manufacturing a medicament for treating or preventing a reuseful in manufacturing a medicament for treating or preventing a syndrome associated with a NOVX-associated disorder such as hypertension, cardiomyopathy, atherosclerosis, cancer, diabetes, asthma, inflammation, autoimmundeficiency syndrome (ADDS), immunoglobulin (Ig) A nephropathy, climtosis, arthitis, Alzheimer's disease, Parkinson's disease, goite, iffections (e.g. bacterial, viral, parasitic), stroke, muscular dystrophy, epilepsy, and other wasting disorders associated with chronic diseases. ACF03571 to ACF03644 repersent PCR primers and probes for NOVX construction.
                                                                                                                                                                                                             New NOVX polypeptide useful for preventing or treating NOVX-associated disorders, e.g. cancer, cardiomyopathy, atherosclerosis or diabetes, and in chromosome mapping, tissue typing or pharmacogenomics.

Human secreted protein SECP-44 SEQ ID NO:44. ABR56769 standard; protein; 154 AA. (first entry) GGHPRPPRGR 107 30-JUL-2003 ABR56769;

Human, secreted protein, SECP, cytostatic, antiarteriosclerotic, anticonvulsant, nootropic, neuroprotective, cerebroprotective, anti-HIV, antiallergic, antiinflammatory, thyromimetic, gene therapy, cancer, cell proliferative disorder, thyromizelerosis, neurological disorder; epilepsy, Huntington's disease, stroke, immune disorder, allergy, AIDS, inflammatory disorder, developmental disorder; hypothyroidism; Cushing's syndrome; infection. W02003016506-A2. Homo sapiens 27-FEB-2003.

15-AUG-2002; 2002WO-US027143

vaccine.

```
ARCT9026 to ARR56805, designated SECP-1 to SECP-80. SECP sequences can ARR56726 to ARR56805, designated SECP-1 to SECP-80. SECP sequences can have overceating, antiarterior cartionistic, antiariant, antialiammatory, nootropic, neuroprotective, cerebrotic, antianilammatory, notropic, neuroprotective, cerebrotic antianilammatory, correcting and polymucleotides can be used in dagnosing, treating and preventing diseases or conditions associated with the decreased expression or overexpression of SECP, such as call proliferative (e.g. expression or overexpression of SECP, such as call proliferative (e.g. cancer, atheroscierosis), neurological (e.g. epilepsy, Huntington's disease, stroke), immune/inflammatory (e.g. AlDS, allergies) and disease, stroke), immune/inflammatory (e.g. AlDS, allergies) and compounds on the expression of mucleic acid and amino acid sequences of SECP. The SECP or its fragments are useful in screening compounds for effectiveness as agonist or antagonist of the polypeptides, or in altering the expression of the target polymucleotide and compounds that specifically bind to or modulate the activity of the polypeptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              human, marker, expressed sequence tag, EST; arabidopsis, tumour, stress-induced phenotype, hyperosmotic stress; colon cancer, immunogen;
                                                                                                                                                                                                                                                                                                                                                                                                                                                               New human secreted proteins (SECP), useful for diagnosing, treating and preventing diseases or conditions associated with the aberrant SECP expression e.g. cancer, AIDS, atherosclerosis, Huntington's disease, stroke, infections.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               0; Gaps

The invention relates to a novel method for determining if a nucleic acid is a marker for a predetermined phenotype/cell type of interest from a biological species. The method comprises performing a global comparison of a group of expressed in the phenotype/cell type of interest tith all ESTB known to be expressed in the phenotype/cell type of interest that are preferentially expressed in the phenotype/cell of interest. A method of the invention is useful for determining whether a nucleic acid is a marker for a predetermined phenotype or cell type of interest from a biological species, preferably care tumour cell, and the predetermined phenotype is a stress-induced phenotype such as hyperosmotic stress or high salt conditions. A method of the invention is also useful for determining the progression of colon content in a human, for detecting a tumour cell, and for regulating or preventing the growth of a tumour cell. An antibody of the invention is come in a human, for detecting a tumour cell. An antibody of the invention is content in a human, for detecting a tumour cell. An antibody of the invention is content in a human, for detecting a tumour cell. An antibody of the invention is content in the presence of peptides encoded by the invention for a tumour associated markers. A polypeptide of the invention is useful as an immunogen for vaccinating an animal. The present sequence represents a cumour associated antigen of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human; salivary acidic proline-rich phosphoprotein; PRP; autoantigen, atopic dermatitis-inducing protein; salivary gland; IgE autoantibody; immunoglobulin E; mast cell activation; basophil activation; diagnosis; risk assessment; sensitisation remedy; dermatological; antiallergic;
                                                                                                                                                                                                                                                                                                                                                                                                                        Determining if a nucleic acid is a marker for a phenotype/cell type of interest, by global comparison of expressed sequence tags known to be expressed in the phenotype/cell type with all ESTs expressed in normal
                                                                                                                                                                                                                                                                                                                       Lobashev AV, Krukovskaya LL;

The invention relates to human PRP-1-derived oligopeptides (AAB48771-AAB48783) which contain at least two arginine residues and which protect against dental caries. PRPs (proline-rich proteins) are salivary proteins encoded by six clustered genes on chromosome 12p13.2 and are potential determinants of a person's susceptibility to dental caries. PRPs are fegraded by Actinomyces and Streptococcus species to small peptide fragments. These are metabolised by oral bacteria for nutritional purposes, with certain bacterial species generating ammonia the catabolism of arginine. The peptides of the invention, being arginine-rich, can also be converted to ammonia by these bacteria. The ammonia thus formed raises the pH at the dental surface, thereby protecting the teeth against caries. Sequences AAS48771-B48783 represent the PRP-1-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                New oligopeptides comprising 2 arginine residues from degradation of proline-rich proteins, useful for preventing dental caries.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human, chromosome mapping, gene mapping, gene therapy, forensic; food supplement, medical imaging, diagnostic, genetic disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New isolated polynucleotide and encoded polypeptides, useful in

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to the human atopic dermatitis-inducing proteins, salivary acidic proline-rich phosphoprotein (RRP; ADC9816) and prolactin-inducible protein (FPP; ADC98118), and their post-translationally modified forms. These proteins are secreted by salivary or sweat glands and bind to IgE autoantibodies, thereby activating mast cells and basophils. The invention also relates to antigenic peptide fragments of RPP or PIP, antibodies which bind to PRP or PIP, methods for diagnosing atopic dermatitis by determining whether an individual is at risk of developing atopic dermatitis by determining the presence of PRP- or PIP-specific antibodies or immune complexes, or by quantifying histamine release; and sensitisation remedies for atopic dermatitis containing PRP and/or PIP or their peptides as the active ingredient. PRP, PIP and their antibodies are useful in diagnosing atopic dermatitis. They whether an individual is at risk of developing atopic dermatitis. They are also useful in developing sensitiation remedies for the treatment of atopic dermatitis. The present sequence represents the specifically atopic dermatitis. They are also useful indeveloping sensitiation remedies for the treatment of atopic dermatitis. They resent sequence represents the specifically atomic dermatitis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ô
                                                                                                                                                                                                                                                                                                                                                                                                                                  Atopic dermatitis-inducing proteins, applicable in diagnosis of including risk of onset, and in developing sensitization remedies for the disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human; PRP-1; proline-rich protein; saliva; dental caries;

The invention relates to isolated polymucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain recardion (PCR) primares, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polymucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal crivity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders of sites expressing (II). (I) and (II) are useful for treating disorders olypeptide and polymucleotide sequences have applications in dispostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biddiversity amino acid sequences. ABG00010-ABG30377 represent novel human diagnostic amino acid sequences of the invention. Note: The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO at the printed specification, but was obtained in electronic format directly from WIPO at
diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits and to assess biodiversity.
                                                                                                                                                                                                                                                                        Claim 20; SEQ ID NO 59255; 103pp; English.

Stroemberg N, Johansson I;

New oligopeptides comprising 2 arginine residues from degradation of proline-rich proteins, useful for preventing dental caries.

Claim 4; Page 24; 36pp; English.

ABB48783) which contain at least two arginine residues and which protect against dental caries. PRPs (proline-rich proteins) are salivary proteins encoded by six clustered genes on chromosome 12pl3.2 and are potential determinants of a person's succeptibility to dental caries. PRPs are degraded by Actinomyces and Streptococcus species to small peptide fragments. These are metabolised by oral bacteria for nutritional purposes, with certain bacterial species generating ammonia via the catabolism of arginine. The peptides of the invention, being arginine-rich, can also be converted to ammonia by these bacteria. The ammonia thus formed raises the pH at the dental surface, thereby protecting the derived oligopeptides of the invention The invention relates to human PRP-1-derived oligopeptides (AAB48771-

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Description

Sequence 31405, Application US/09252991A

Parent No. 6551795

GENERAL INFORMATION:
APPLICANT: Marc J. Rubenfield et al.
TITLE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO PSEUDOMONAS
TITLE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO PSEUDOMONAS
TITLE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO PSEUDOMONAS
TITLE COF INVENTION: AERUGINOSA FOR DIAGNOSTICS AND THERAPEUTICS
CURRENT APPLICATION NUMBER: US/09/252,991A
CURRENT FILING DATE: 1999-02-18
PRIOR FILING DATE: 1998-02-18
PRIOR FILING DATE: 1998-02-18

Sequence 17675, Application US/09252991A

Sequence 17675, Application US/09252991A

Patent No. 6551795

GENERAL INFORMATION:
APPLICANT: Marc J. Rubenfield et al.
TITLE OF INVENTION: MUCHEIC ACID AND AMINO ACID SEQUENCES RELATING TO PSEUDOMONAS

TITLE OF INVENTION: AERUGINOSA FOR DIAGNOSTICS AND THERAPEUTICS

TITLE OF INVENTION: AERUGINOSA FOR DIAGNOSTICS AND THERAPEUTICS

CURRENT APPLICATION NUMBER: US/09/252,991A

CURRENT PILING DATE: 1999-02-18

PRIOR FILING DATE: 1999-02-18

PRIOR FILING DATE: 1999-02-18

PRIOR FILING DATE: 1998-07-27

NUMBER OF SEQ ID NOS: 33142

SEQ ID NO 17675

LENGTH 237
                                                                                                                                                                                                                                            Sequence 16715, Application US/09252991A

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             at positions 1911, 1915 and 1917 in 238 ribosomal RNA.

-!- FUNCTION: Responsible for synthesis of pseudouridine from uracil
at positions 1911, 1915 and 1917 in 238 ribosomal RNA.

-!- CATALYTIC ACTIVITY: Uracil + D-ribose 5-phosphate = pseudouridine
5'-phosphate + H(2)0.

-!- SIMILARITY: Belongs to the pseudouridine synthase rluA family.

-!- SIMILARITY: Contains 1 S4 RNA-binding domain.

-!- CAUTION: Ref. 4 sequence differs from that shown due to a frameshift in position 133.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps

                                                                                                                                                                                                                                                                                    -!- CATALYTIC ACTIVITY: Uracil + D-ribose 5-phosphate = pseudouridine 5'-phosphate + H(2)0.
-!- SIMILARITY: Belongs to the pseudouridine synthase rlua family.
-!- SIMILARITY: Contains 1 S4 RNA-binding domain.
                                                                                                                                                  SEQUENCE OF 1-250 FROM N.A.

Dy a cyclic transcriptional enhancer responsive to notch signaling.";
Dy a cyclic transcriptional enhancer responsive to notch signaling.";
Dr. Cell 3:63-74(2002).
In Motal Glycosyltransferace that initiates the elongation of O-
linked fucose residues attached to EGF-like repeats in the
extracellular domain of Notch molecules inhibiting Jagged mediated
Notch signaling. Bissential mediator of somite segmentation and
patterning. During somite Doundary formation, it restricts Notch
control of Notch and Committee as Section and patterning the presentic mediator of Somite segmentation and
cotivity in the presentic mesoderm to a boundary-formig territory
in the posterior half of the prospective somite. In this region,
Notch function activates a set of genes that are involved in
Control of the prospective somite involved in
Control of the prospective somite involved in
Control of the prospective monthment and promotes B
coll development in lymphoid progenitors. May play a role in
boundary formation of the enamel knot.
Contained from the proposition of the propos
                                                                                                                                                                                                                                                                                                                                                                                                                                  MEDLINE=99264507; PubMed=10330372; del Barco Barrantes I., Elia A.J., Wuensch K., De Angelis M.H., Mak T.W., Rossant J., Conlon R.A., Gossler A., de la Pompa J.L.; Interaction between Notch signalling and Lunatic fringe during somite boundary formation in the mouse."; Curr.                                                                                                      DEVELOPMENTAL STAGE: Developmental protein. During segmentation it shows a cyclic transcription pattern which is under the control of Notch. Expressed in the caudal region of the presontic mesoderm with each cycle corresponding to the formation time of one somite. In the dental epithelium it is detected at stage E13.5. The pattern of expression corresponds exactly to the formation of the enamel knot between late bud and early cap stages.

PTM: A soluble form may be derived from the membrane form by
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          28-FEB-2003 (Rel. 41, Created)

MILLY Zhu X. Zh. X. Roullard J.M., Ambros P.F., Lamb B.J.,

Kuick R., Eckart M., Weinhausl A., Fonatech C., Hanash S.M.;

"Combined restriction landmark genomic scanning and virtual genome scans identify a novel human homeobox gene, ALX3, that is hypermethylated in neuroblastoma.";

I. Genes chromosomes Cancer 33:285-294(2002).

C. - FUNCTION: Transcriptional regulator with a possible role in patterning of mesoderm during development (By similarity).

C. - SURCEBLUIAR LOCATION: Nuclear [By similarity).

C. - SURCEBLUIAR Contains 1 homeobox domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ALX3 HUMAN STANDARD; PRT; 343 AA.

                                                                                                                   FUNCTION: Glycosyltransferase that initiates the elongation of O-
linked fucose residues attached to BGP-like repeats in the
extracellular domain of Notch molecules inhibiting Jagged mediated
Notch signaling. Essential mediator of somite segmentation and
patterning (By similarity).
CATALYTIC ACTIVITY: Transfers a beta-D-GloNAc residue from UDP-D-
GLONAC to the fucose residue of a fucosylated protein acceptor.
SUBCELLULAR LOCATION: Type II membrane protein. Golgi (By
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        MEDINE=21564202; PubMed=1170702;

New oligopeptides comprising 2 arginine residues from degradation of proline-rich proteins, useful for preventing dental caries.

Claim 4; Page 24; 36pp; English

The invention relates to human PRP-1-derived oligopeptides (AAB48771-AAB48783) which contain at least two arginine residues and which protect against dental caries. PRPS (proline-rich proteins) are salivary proteins encoded by six clustered genes on chromosome 12p13.2 and are potential determinants of a person's susceptibility to dental caries. PRPs are degraded by Actinomyces and Streptococcus species to small peptide fragments. These are metabolised by oral bacteria for nutritional purposes, with certain bacterial species generating ammonia via the catabolism of arginine. The peptides of the invention, being arginine-rich, can also be converted to ammonia by these bacteria. The ammonia thus formed raises the pH at the dental surface, thereby protecting the teeth against caries. Sequences AAB48771-B48783 represent the PRP-1-

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to human PRP-1-derived oligopeptides (AAB48771-AAB48783) which contain at least two arginine residues and which protect against dental caries. PRPS (proline-rich proteins) are salivary proteins encoded by six clustered genes on chromosome 12p13.2 and are potential determinants of a person's susceptibility to dental caries. PRPs are fragments. These are metabolised by oral bacteria for mutritional purposes, with certain bacterial species generating ammonia the catabolism of arginine. The peptides of the invention, being arginine-rich, can also be converted to ammonia by these bacteria. The ammonia thus formed raises the pH at the dental surface, thereby protecting the teeth against caries. Sequences AAB48771-B48783 represent the PRP-1-

Human genome-derived single exon nucleic acid probes useful for analyzing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human genome-derived single exon nucleic acid probes useful for analyzing
                                                                                                                                                                                                                                                                           The present invention relates to single exon nucleic acid probes (SENP: see AA131315-AA157546). The present sequence is a peptide encoded by one such probe. The probes are useful for producing a microarray for predicting, measuring and displaying gene expression in samples derived from human placenta. The probes are useful for antenatal diagnosis of human genetic disorders
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human bone marrow expressed probe encoded protein SEQ ID NO: 32364.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human; bone marrow expressed exon; gene expression analysis; probe; microarray; cancer; leukaemia; lymphoma; myeloma.
